Recently, the technique for fabricating a semiconductor device having high device packing density, high quality and high reliability is under active development. In general, a semiconductor device fabricating process involves a semiconductor substrate forming step of forming a semiconductor substrate having a semiconductor device is formed on a mother substrate. A semiconductor chip is fabricated in the semiconductor substrate. The semiconductor substrate and the semiconductor chip are cut and formed into individual semiconductor device chips. After that, an exposure process, an etching process, a passivation process and the like are performed on the semiconductor substrate. Then, a liquid crystal display (LCD) substrate is attached to the semiconductor substrate and subjected to an aligning process to be aligned with the semiconductor substrate. Thereafter, a sealant material is injected between the semiconductor substrate and the LCD substrate to form a liquid crystal seal area in a 09e8f5149f
