Threat Scan can detect Dialer, Trojan, Spyware, Downloader, Dropper, Adware. Bitdefender Ransomware Removal Guide Ransomware is a brand of malicious software (malware), that usually comes bundled with a potentially unwanted application. It is a so-called Trojan that preys on the victim's good nature by providing misleading options that appear to be only options to display ads. These ads may come with a browser extension, an ActiveX control or even adware. Ransomware also makes sure that the user is not distracted from the installation by other pop-up ads, along with other distractions. Thus, it seems to be a promising new malware. However, in reality, the primary function of this particular Trojan is to look for more money. While the first generation of ransomware demanded payment in Bitcoins, the second generation is growing much more often and demanding payments in other crypto-currencies. It also has been evolved to grab all the important data from the system and encrypt it in order to demand much higher sums. If the ransom is not paid, the data will be deleted. Ransomware is a large and complex problem. It is difficult to identify what its every component is, but it is possible to notice that it is distributed by malware packages of other kinds. This includes Trojan programs, adware, browser toolbars, and even hacked versions of well-known software. Ransomware and other security threats often include similar features that pose a problem in their detection. They usually come bundled together with other software that the user was not even aware of. This is particularly true for applications downloaded through torrent sites or similar sites. It is not easy to identify the malicious file, and
